The Ministry of Science and Technology of India has issued a special issue of the journal of the Indian Institute of Science (IISc) - Organometallics, Catalyst Controls and Catalysis, on a study on the environmental impact of certain pharmaceutical compounds as catalysts. In their introduction, Prasad and Goraya say that the main objectives of this study were to determine the following : (i) the effect of the presence of a co-catalyst on the catalytic conversion of selected drugs to their respective trans-dehydrocoumarin derivatives; (ii) the environmental impact of co-catalyst treatments and (iii) the recyclability of the co-catalysts. The cost of performing the study may have been high, but the study showed that from a pollution-generating perspective, treatment of the wastewater with an activated alumina co-catalyst is significantly better than that of unmodified silica-based silica gel. The present study also revealed that co-catalyst treatment would allow for the recycling of the used catalyst. They say that the simple treatment of used wastewater effluent could provide a virtuous end to the adverse environmental impacts that are generally associated with the industrial wastewater. However, they say that the study was not intended to propose an absolute rule for the treatment of wastewater, but established a guide for the development of technologies for the treatment of pharmaceutical wastewater. They also say that the study showed the enrichment of the hydrocarbon fraction of the co-catalyst and not the heavy metals present in the wastewater streams. Prasad and Goraya explain that drug hydrolysis in wastewater may lead to the generation of inorganic salts, which may precipitate out of solution upon dosing. they explain that the term drug hydrolysis is used to describe the dissolution of a drug in aqueous solution, and the subsequent dissolution of the drug into its intermediate products The authors say that the hydrolysis of a drug usually occurs in pharmaceutical products containing a water soluble prodrug which undergoes an enzymatic reaction to form the desired 2d92ce491b
