The headrest supports the head of the passenger so that a risk of neck strain caused by an abrupt increase in the speed of the vehicle and/or the vibration of the vehicle is reduced. A headrest also protects the head of the passenger from the impact of an unexpected collision. For example, a headrest is used to protect the head of a child passenger who is smaller than other passengers. A headrest used in a vehicle seat is connected to the vehicle body via a wire harness in order to electrically connect the headrest and an electric device on the vehicle body. In this case, the wire harness includes electrical wires for electrically connecting the headrest and a controlling unit mounted on the vehicle body, electrical wires for controlling the headrest, and electrical wires for inputting an external signal to the headrest from an external device such as a display or the like. The wire harness is disposed in the seat back, the seat back frame, the headrest frame, and the headrest cover. Therefore, a significant length of the wire harness is formed inside the headrest 2d92ce491b
