The new technology is called a tamper-resistant hardware design. That doesn't mean it's impossible to crack, but it does mean that companies are adding security measures to their phone designs that make it more difficult. Samsung's Galaxy S5 is the latest victim of this idea, but it's not the only company fighting it. Another company that's been in the news lately is LG, but the South Korean company has decided to back down on using a similar feature. LG's idea was to use a hardware key to confirm the authenticity of the software on the phone. I don't have a Galaxy S5, but a co-worker of mine has one and he told me about the feature. I asked him to test it and he tried to open the app store on his S5. And he couldn't. He even tried to disable the feature on his S5 and the software wouldn't let him. There is a way around this feature, but it's not easy. The same way that you can sign in to Gmail with your Google ID, you can also sign in to your app store with your Google account. So if you need to open the app store, you have to allow it. But Google doesn't know who you are so it won't let you access the app store without letting you know who you are. LG does use a unique ID called a serial number, but it's hidden inside the device. So if you can't easily disable the feature and you can't access the app store, what are you supposed to do? Not very much, it seems. Well, you can reset your phone by using the factory reset function. The downside to that is you lose all your data on the phone. So, if you're
