Virtual Piano [Mac/Win]

Virtual Piano is a fun application designed to emulate a piano's touch, using a grid of colored buttons that you can click to produce notes of music. Virtual Piano puts a unique twist on the traditional piano keyboard by arranging 25 buttons that represent the musical notes of C Major, the common scale of Western music. Selecting one of these buttons causes the piano to play the note. This application is intended to create a tool that lets children learn the basics of music, and that makes having fun with it an enjoyable experience for all ages. You don't need to know anything about the music you are playing – and all the musical skills you need to play the piano are already there. Virtual Piano has been designed to be as useful for a child as it is for a music teacher. While studying music, children find it easy to play the piano with Virtual Piano because it has the appearance of a real instrument. However, it is also just as suitable as a teaching aid for music theory courses,

as it can be used to simplify learning of music symbols and scales. As a piano teacher, I hope that my students will use Virtual Piano to practice the basic theory behind the notes and chords of the keyboard. Upon launch, you are given the choice of the classical music scale used in Western countries (such as the C major scale), and you are presented with two modes, One and Two. You can choose to play chords using the keyboard or with chord shapes on the screen, to produce the most basic musical notes: D E G Bb C. While using Virtual Piano as a teaching tool, it is important to allow the student to select the melody for himself, since this is the part of the musical composition that makes the most sense for him. To the right of the buttons, on the top line, are "Control", which allows you to jump to a new note or to stop the music, and the "F Key", which allows the notes to be displayed with all the keys at the same time. You can also play a note without seeing the keyboard by simply clicking "F". The program is used with many Windows systems. Windows XP, Windows 2000, Windows 95, Windows 98, Windows Me and Windows 2000. All of them are supported. However, the program does not have any means for detecting the amount of RAM installed in the computer, and it does not add itself to your system tray like most programs that make use of the system tray

Virtual Piano is a simple application for playing piano using the keyboard. Very little more than a glorified tile video game, Virtual Piano is a simple title that enables you to play the piano using only the keyboard. The idea is simple: the application is controlled by a regular keyboard and it displays a virtual keyboard where you can play the instrument. The game doesn't contain many features, but it's quite playable. You need to use the keyboard and hit all the keys to play the tune. You play the notes one by one using the keyboard and you can play several notes simultaneously using the Space Bar. The application remembers the notes you played and executes them with each key that you press. It contains some MIDI controls which enable you to play the piano using MIDI or a joystick. The application is a very easy-to-use title and it's ready to use right away. It's an interesting concept that deserves a thumbs up.
