I am really confused, they both have pros and cons, so i am not really sure which one should be used. A: My rule of thumb is to use what fits your business best. If you find that your virtual environments are too cumbersome to administer and maintain, then maybe you need a physical server to ease the burden. Your decision should be guided by your business needs, not by which platform is easier to use. You should be able to find a lot of useful information in these two great whitepapers on VMware and ESX. The second one has a lot more to it, including discussions of the pros and cons of both platforms. A: You should evaluate what you need and what you want to achieve. If you want to run VMs as is, you can use either. You can even combine ESX with a physical server if you don't have a separate server (not available in all regions yet but will become available). I wouldn't recommend using a physical server for this though, since VMs offer more flexibility than physical servers, which allows you to concentrate your resources on your business, and not on servers. ESX is a virtualization solution, and a complete virtualization solution. It doesn't focus on any particular aspect. VMware ESX Server is a platform that allows you to run the virtualization technology of your choice. You can even run VMware ESX Server on a physical server (I do it myself) but you'll have to pay attention to physical server resource constraints, such as memory/CPU. It is possible to use VMware ESX Server without a physical server but you'll have to rely on the advantages of being able to load balance VMs. Here's a useful link that explains it in more details: Chronic treatment with cholera toxin does not alter intestinal mast cell number in the rat.
